Quarto's docs evolve fast, and the YAML option surface is large enough that guessing wrong wastes a render cycle. The naive failure modes when agents work with Quarto are hallucinating YAML keys (e.g. `format.html.sidebar` when sidebars are top-level `website.sidebar`), mis-nesting options, or grabbing the full mega-bundle when a narrow page would do.

This skill is a navigation map: which `quarto.org/llms.txt` bundle to fetch for which kind of question, which per-page `.llms.md` URLs are useful, and which load-bearing yml keys (listings, navbars, themes, citations, freeze) have non-obvious shapes.

It is used heavily inside `vade-coo-memory` for the publishing site this page is rendered through. The skill itself is portable — nothing about it presumes VADE.

Install

Drop the skill directory into your project's `.claude/skills/`. The setup script in the public repo does this for you.
